

LUMII
ADVISORY

FIND YOUR LIGHT

in the Age of AI

*The 90-Day AI Strategy System
for Business Leaders*

Agata Adamczak · Founder, Lumii Advisory · 2026

“I’ve spent ten years watching organisations make the same AI mistakes in slow motion. Different budgets. Different industries. Same outcome: expensive tools, underwhelming results, and a leadership team that quietly blames the technology.”

The technology is almost never the problem.

The problem is strategy adopted after the purchase. Governance designed after the crisis. Use cases chosen because they sounded impressive in a board presentation, not because they solved a real problem.

This guide is different. It is opinionated by design. It will tell you things most AI consultants won’t, because most AI consultants have a platform to sell you. Lumii doesn’t. Our only agenda is your outcome.

— Agata Adamczak, Founder, Lumii Advisory

78%

organisations using AI in at least

CHAPTER 01

Why Most AI Rollouts Fail

Five patterns we see every time.

Most AI initiatives don't fail at the end. They fail before they begin.

The decision to invest comes before the decision to think. A CEO attends a conference, hears a competitor mention their AI programme, and comes back Monday with urgency. Within six weeks there's a pilot. Within six months, a quiet conversation about why it hasn't scaled. Within a year, a new tool to replace the first one.

This is not a hypothetical. We see it constantly. The pattern is always the same: the wrong questions get answered in the wrong order.

THE UNCOMFORTABLE TRUTH

Most organisations don't have an AI problem. They have a clarity problem. AI just makes it more expensive and more visible.

The Five Failure Patterns

1. The Vendor-Led Strategy

You let a technology vendor define your AI roadmap. Their incentive is adoption, not outcomes. Their use cases are designed for their platform, not your business.

A mid-size retailer spent \$400K on an AI personalisation engine recommended by their eCommerce vendor. Eighteen months in, conversion had moved 0.2%. The real problem — checkout friction — had never been addressed. The vendor's platform didn't solve that.

2. The Pilot Graveyard

Multiple teams running disconnected experiments. No shared learning. No clear owner. No path to production. Gartner found 30%+ of GenAI projects are abandoned before production.

The Pilot Graveyard isn't a failure of imagination. It's a failure of governance. Someone approved every one of those pilots. No one asked: what happens if it works?

3. The Orphaned Initiative

AI gets delegated to IT. IT builds something. No one in the business asked for it, so no one uses it. Gartner found 91% of high-maturity AI organisations have a dedicated AI leader at the business level.

4. The Metric Vacuum

There is no baseline. No measurement framework. No answer to “is it working?” Gartner identified demonstrating AI value as the top adoption barrier — cited by 49%.

5. The Culture Ambush

The tool goes live. Adoption is poor. Leadership blames the tool. KPMG found 73% of employees who tried AI and stopped cited being “too overwhelmed to implement new processes.”

WHAT ACTUALLY WORKS IN PRACTICE

The organisations that succeed start with a blunt internal audit: what are the three processes in this business where a 20% improvement would materially change a commercial outcome? That question — not “what AI tools should we buy?” — is where every AI strategy should begin.

02
CHAPTER 02

The Signal/Noise Diagnostic™

Where does your business actually stand?

Before you choose a single tool, you need a clear picture of your starting position. Not where you hope you are. Where you actually are.

Most organisations skip this step because it's uncomfortable. The readiness audit reveals gaps that leadership would rather not put in writing. But skipping it is exactly how you end up with a pilot that works in the demo and fails in production.

THE SIGNAL/NOISE DIAGNOSTIC FRAMEWORK

A Lumii Advisory proprietary readiness framework

Five dimensions. Each scored 1–5. Total score determines your AI tier and the specific actions that will move you forward fastest. Not generic advice — a precise starting point based on where you actually are.

The Five Dimensions

D1 — Data Signal Strength

How clean, connected, and accessible is your data? Gartner found 63% of organisations lack AI-ready data practices, and predicts 60% of AI projects without quality data will be abandoned through 2026.

Score 1: Data is siloed, inconsistent, manually extracted. Score 5: Core data is centralised, clean, API-accessible, and governed.

D2 — Process Crystallisation

AI accelerates what is already clear. If a process is ambiguous to your team, it will be invisible to AI.

Score 1: Key processes are undocumented and inconsistent. Score 5: Core processes are mapped, measured, and owned.

D3 — Team AI Fluency

KPMG's 2025 survey found 87% of organisations cite upskilling as mission critical — but fewer than half of employees say their employer provides adequate training.

Score 1: No formal AI literacy. Shadow usage only. Score 5: Role-specific AI training embedded in onboarding and workflows.

D4 — Stack Connectivity

Legacy systems are the silent killer of AI initiatives. Evaluate integration readiness before you evaluate AI tools.

Score 1: Fragmented stack. Limited APIs. Major re-platforming required. Score 5: Modern, connected stack. AI tools integrated in weeks, not quarters.

D5 — Leadership Conviction

McKinsey's high performers are three times more likely to have senior leaders actively engaged in AI adoption.

Score 1: AI is delegated to IT. No executive ownership. Score 5: Clear AI owner at C-level. Regular leadership review.

Score Yourself

DIMENSION	1	2	3	4	5	YOUR SCORE
D1 — Data Signal Strength	☐	☐	☐	☐	☐	
D2 — Process Crystallisation	☐	☐	☐	☐	☐	
D3 — Team AI Fluency	☐	☐	☐	☐	☐	
D4 — Stack Connectivity	☐	☐	☐	☐	☐	
D5 — Leadership Conviction	☐	☐	☐	☐	☐	
TOTAL SCORE (5–25)						

5–12: Tier 1 Exploring | 13–19: Tier 2 Building | 20–25: Tier 3 Scaling

YOUR READINESS TIER

TIER 1 —
EXPLORING
(5–12)

Limited foundations. One clear use case and a quick win is the entire strategy. Nothing else.

TIER 2 —
BUILDING
(13–19)

Foundations forming. Formalise the roadmap. Establish governance. Double down on one working use case.

TIER 3 —
SCALING
(20–25)

Strong base. Embed AI into core workflows. Build competitive moat. Move to AI-native operations.

THE UNCOMFORTABLE TRUTH

Most organisations self-score 2–3 points higher than they actually are. The Signal/Noise Diagnostic works best when completed by someone outside the project team. Self-assessment is the least reliable input you have.

Sources: Gartner 2024–2025 · KPMG AI Pulse Survey 2025 · McKinsey State of AI 2025

03
CHAPTER 03

The Value Gravity Map™

Finding your highest-return use cases.

The question is never “what can AI do?” The question is always “where in this business does AI create an outcome someone will actually pay for?”

McKinsey has sized the prize: generative AI could contribute \$2.6 to \$4.4 trillion annually across enterprise use cases. But 75% of that value sits in just four areas: customer operations, marketing and sales, software engineering, and R&D.;

THE VALUE GRAVITY MAP FRAMEWORK

A Lumii Advisory use case prioritisation tool

Map every AI idea against two axes: Value Gravity (how much commercial pull does this create?) and Activation Friction (how hard is it to actually build and adopt?). High gravity and low friction: your launch pad. Everything else: sequenced, parked, or dropped.

The Four Gravity Zones

Sources: McKinsey Global Institute · BCG AI Value Report · Gartner 2024

04

CHAPTER 04

The Lumii Momentum Method™

From scattered experiments to a clear roadmap.

A list of AI use cases is not a strategy. A strategy is a sequence with owners, metrics, and a theory of compounding.

Most organisations treat their AI roadmap as a backlog — a growing list of ideas ranked loosely by enthusiasm. The teams who make real progress treat the roadmap as a momentum machine: each initiative chosen partly for its own value, partly for what it makes possible next.

THE LUMII MOMENTUM METHOD FRAMEWORK

A Lumii Advisory sequencing and execution framework

Three stages: Prove, Expand, Embed. Each stage has a specific objective, success criterion, and unlock condition for the next. You cannot skip stages. You can move through them faster than you think.

You've already mapped and prioritised your use cases using the Value Gravity Map in Chapter 3. That visual showed you which initiatives have high gravity and low friction. The next question: in what order do you execute, and how do you make each stage fund the next?

The Three Stages of Execution

STAGE 1 — PROVE

Months

1–2

- One use case. One metric. Close supervision.
- Document everything — what worked, what didn't, what surprised you.
- Share results internally before scaling. Stage 1 builds credibility, not scale.

Months

STAGE 2 — EXPAND

3–6

- Scale what proved out. Add one strategic bet.
- Establish governance before you need it — not after a crisis.
- The fastest Stage 2 teams did their governance work in Stage 1.

STAGE 3 — EMBED

Month 7+

- AI is no longer a project. It is how work gets done.
- Measurement is routine. Capability is owned internally.
- The question shifts: not “should we?” but “how fast can we?”

“

The organisations that move fastest through AI adoption are not the ones who started earliest. They're the ones who started smallest and learned fastest.

— Agata Adamczak, Lumii Advisory

05
CHAPTER 05

People, Culture & the Trust Gap

The questions technology can't answer.

AI adoption fails at the human layer more often than the technology layer. Every time.

KPMG's Generative AI Adoption Index found 73% of employees who started using AI and stopped cited being "too overwhelmed to implement new work processes." Not scepticism. Not resistance. Overwhelm.

Most AI implementation plans allocate 90% of budget to technology and 10% to the humans who have to change their behaviour for that technology to matter.

THE UNCOMFORTABLE TRUTH

The biggest predictor of AI adoption success is not budget, tools, or data quality. It is whether your team believes leadership actually cares if it works. Visible executive engagement is the most underrated lever in AI implementation.

Ownership: The One Non-Negotiable

Gartner found 91% of high-maturity AI organisations have a dedicated AI leader at the business level. Not a job title. A human being who wakes up every morning accountable for AI outcomes, with the authority to make decisions across functions.

The COO or CTO as AI lead

Effective when AI is primarily operational. Risk: can become infrastructure-focused and lose connection to revenue outcomes.

A cross-functional AI lead

An existing senior leader given explicit AI accountability. Requires authority to convene peers and the credibility to be heard.

An external strategic advisor

The right choice when building capability takes time you don't have. Strategic direction without the overhead of a full-time hire.

Building Genuine AI Fluency

Generic AI training is box-ticking. Real fluency is role-specific, task-specific, and immediately applicable.

The training that moves the needle shows a marketer exactly how to use AI in their actual content workflow. Shows a sales rep exactly how to use AI in their actual pipeline. Shows a finance analyst exactly how to use AI in their actual reporting cycle.

WHAT ACTUALLY WORKS IN PRACTICE

Identify your two or three most forward-leaning team members per function, give them dedicated time to experiment in their own workflows, and have them teach back to the team. Peer learning in context is ten times more effective than vendor-led training in a room.

Governance That Enables

Most governance frameworks are written by lawyers, for lawyers. They describe what you cannot do in exquisite detail and say nothing about how to do the right thing well.

Effective AI governance answers three questions for every team member: what am I allowed to use AI for? What data can I share? Who do I talk to if I'm not sure? If it can't be summarised in three sentences per role, it won't be used.

06
CHAPTER 06

The Three Dials of AI ROI™

A framework for measuring what actually matters.

The inability to demonstrate AI value is not a data problem. It is a framework problem. Most organisations measure the wrong things.

Gartner found demonstrating AI value was the top barrier to AI adoption, cited by 49% of organisations — ahead of talent, data, and technical challenges. Not because AI isn't delivering. Because organisations never defined what “delivering” would look like before they started.

THE THREE DIALS OF AI ROI FRAMEWORK

A Lumii Advisory measurement framework

Three dials, three layers. Turn all three before you claim ROI. Turn only one and you have an activity metric, not a business result.

The Three Dials

01

Adoption

ARE PEOPLE ACTUALLY USING IT?

Usage without outcomes is noise. But you cannot reach outcomes without adoption. If adoption is low, the problem is almost never the tool. It is almost always change management.

Active users/week · Tasks completed by AI · % of target audience using regularly

02

Efficiency

IS IT SAVING REAL TIME OR COST?

Hours saved per week multiplied by fully-loaded cost rate gives you a number your CFO will recognise. This dial bridges “it’s useful” and “it pays for itself.”

Hours saved/week · Reduction in cycle time · Headcount equivalent · Cost per output

03

Commercial Impact

IS IT MOVING A NUMBER THAT MATTERS?

The dial that justifies continued investment, secures budget for the next initiative, and tells the board a coherent story. Requires a baseline and patience.

Conversion rate · Revenue per employee · NPS · Pipeline velocity · Customer retention

The Fourth Dimension: People ROI

There is a fourth measurement most organisations overlook entirely: what AI is doing for your people. This is not soft. It is increasingly commercial.

When AI handles the low-value, repetitive work — the reports nobody wants to write, the data entry, the formatting, the first draft nobody enjoys — your best people spend more time on the work they were actually hired to do. The work that grows them. The work that makes them want to stay.

79%

of knowledge workers report meaningful productivity gains

KPMG Canada, 2025

3.6h

saved per knowledge worker per week on average

Gartner, 2024

\$3.70

in value per dollar invested for early GenAI movers

Multiple, 2025

Measure what the data won't tell you automatically

Add these to your measurement framework: employee sentiment on AI (is it making their work better or just adding noise?), skills growth rate (are your people developing capabilities they value?), and retention of high performers in AI-enabled teams. The organisations that get this right don't just use AI to do more. They use AI to build a workplace where talented people choose to stay and grow.

Employee AI Sentiment Score	Monthly pulse: is AI making my work better or worse?
Skills Growth Velocity	Rate at which team members develop new AI-adjacent capabilities
Retention in AI-Enabled Teams	Compare attrition: AI-enabled roles vs non-AI roles
Learning Engagement Rate	% of team actively developing AI skills by choice, not mandate

WHAT ACTUALLY WORKS IN PRACTICE

Set your baseline metrics before day one of any AI initiative. Without a baseline, you have no story. Without a story, you have no budget for phase two. Include a people metric from the start — not because it's nice to have, but because it is the leading indicator of whether your AI programme will compound or plateau.

07
CHAPTER 07

Your 90-Day Activation Plan

A clear, executable path forward.

Thinking time is over. Here is exactly what to do in the next 90 days.

This is not a project management template. It is a momentum architecture. Every action is chosen because it either creates immediate value or unlocks the next phase.

Each phase builds on the last. Work through them in order. The discipline is the strategy.

Phase 1 — Illuminate

Weeks 1–4

1. Run the Signal/Noise Diagnostic. Score all five dimensions honestly.
2. Identify top 3–5 use cases using the Value Gravity Map. Quantify the prize for each.
3. Document current-state baselines: time, cost, and quality for every candidate.
4. Name your AI lead. One person. Accountable. Empowered to make decisions.
5. Brief the leadership team. Align on one use case to prove in Stage 1.

Phase 2 — Align

Weeks 5–8

1. Select your Stage 1 use case. Write a one-page brief: problem, metric, owner, timeline.
2. Evaluate 2–3 tools on real data. Involve the people who will actually use them.
3. Draft minimum viable governance: three rules per role, maximum.
4. Set Dial 1, 2, 3, and People ROI targets before you build anything.
5. Communicate to the team. What, why, and how their role is involved.

Phase 3 — Activate

Weeks 9–12

1. Launch your Stage 1 initiative. Narrow scope. Supervised rollout. Weekly check-ins.
2. Measure all dials from week one. Track against your baseline relentlessly.
3. Run role-specific enablement. Practical, hands-on, use-case specific.
4. Week 12: review results, document learnings, update the roadmap.
5. Present to leadership. Make the case for Stage 2 with evidence you have built.

The one thing that separates the businesses that succeed

It isn't budget. It isn't tools. It isn't even talent. It's the decision to start small, measure honestly, and build on what actually works. The 90 days above are not a transformation. They are the proof of concept for a transformation. And that proof of concept is everything.

“

The best AI strategy in the world is worthless without the discipline to execute it. Start. Measure. Learn. Repeat.

THE LUMII SYSTEM AT A GLANCE

Every framework in this guide feeds the next. The Signal/Noise Diagnostic tells you where to start. The Value Gravity Map tells you what to build first. The Lumii Momentum Method tells you how to sequence and execute. The Three Dials tell you how to prove it worked. Together, they form a complete AI strategy system — not a collection of tools, but a coherent way of thinking.

WHAT ACTUALLY WORKS IN PRACTICE

The businesses that win with AI are not the ones that move fastest. They are the ones that think clearest. Use this system. Apply it to your specific context. Build on what works. Discard what doesn't. That is how strategy compounds.

READY TO GO FURTHER?

This guide gives you the thinking. Lumii Advisory gives you the expertise.

The next step is an AI Readiness Conversation — a focused 60-minute session with Agata to run the Signal/Noise Diagnostic on your business, identify your highest-gravity use cases, and map a clear 90-day activation path. No pitch. No agenda. Just the most useful hour you'll spend on AI this quarter.
